

Creation(initialization)

### Before Create

This hook runs the second you initialize your component, before data has been made reactive and events haven't been set up.

Observe Data

Init Event

### Create

You can now access your data and events, templates and virtual dom are not yet mounted or rendered.

Has "el" Option?

Has Template Option?

Compile Template Into Render Function

Compile "el" Outer HTML as Template

Create vm \$el and Replace "el" With It

### Mounted:

You can now immediately modify the DOM, reactive components, and templates before or after the initial render.

Mounted

Virtual DOM Re-render and Patch

### Before Update

Gives you the new state of any reactive data on your component before it is rer-rendered.

### Before Destroy

Allows you to clean up and events or reactive subscription before the component is destroyed.

Tear Down Watchers Child, Components, and Event Listeners

### Updated

Gives you access to the DOM after a property change

### Destroyed

Component is completely destroyed. You can now do a last minute cleanup or inform the remote server.

DESTROYED!
